

Crystal Data: Hexagonal. *Point Group:* 6/m. As aggregates and patches of radiating to subparallel groups of nearly equant to prismatic crystals to 0.5 mm.

Physical Properties: *Cleavage:* Distinct on {0001}. *Fracture:* Even to conchoidal. *Tenacity:* Brittle. Hardness = ~5 D(meas.) = 4.66(1) D(calc.) = 4.66 May be metamict.

Optical Properties: Opaque to translucent. *Color:* Pale yellow, tan, reddish brown; pale yellow in transmitted light. *Streak:* Colorless to pale brown. *Luster:* Adamantine. *Optical Class:* Uniaxial (-). $\omega = 1.792(5)$ $\varepsilon = 1.786(5)$ Nonpleochroic to weakly pleochroic from yellowish, light orange to light brown (Argentina).

Cell Data: *Space Group:* P6₃/m. $a = 9.517(5)$ - $9.537(6)$ $c = 6.983(4)$ - $7.008(5)$ Z = 2

X-ray Powder Pattern: Mont Saint-Hilaire, Quebec, Canada, after heating at 800 °C for 3 hours. 2.845 (100), 2.822 (40), 1.870 (40), 2.747 (30), 1.970 (30), 4.11 (20), 3.494 (20)

(1) Mont Saint-Hilaire, Quebec, Canada; average electron microprobe analysis; corresponding to (Ca_{1.95}Ce_{1.39}La_{0.76}Nd_{0.31}Pr_{0.17}Y_{0.09}Th_{0.05}Sr_{0.03}Sm_{0.03}) $\Sigma=4.78$ (Si_{2.68}P_{0.31}) $\Sigma=2.99$ O_{12.02}F_{0.98}.

Mineral Group: Apatite supergroup, britholite group.

Occurrence: In vugs in nepheline syenite, marble xenoliths, sodalite syenite xenoliths, and pegmatite dikes (Mont Saint-Hilaire).

Association: Analcime, microcline, aegirine, zircon, biotite, pyrophanite, astrophyllite, ancylite, natrolite, monazite (in vugs); fluorite, pectolite, calcite, aegirine, carbonate-apatite, biotite, gotzenite (in marble xenoliths); lovozerite, lueshite, ussingite, eudialyte, steenstrupine, gmelinite, phillipsite, chabazite, sodalite, analcime, serandite, albite. Monazite-(Ce), fluorite, quartz, uraninite (Colorado).

Distribution: From Mont Saint-Hilaire, Quebec, Canada [TL]; from the Sakharjok massif, Kola Peninsula, Russia; abundant at Rodeo de los Molles, Central Argentina. At the "Rusty Gold" deposit, SE side of the Longs Peak-St. Vrain intrusion, near Jamestown, Colorado, USA.

Name: As the *fluorine-dominant* analogue of *britholite-(Ce)*.

Type Material: Canadian Museum of Nature, Ottawa, Ontario.
